DOCUMENT TYPE
AI Diagnostic Report

PATIENT —	REFERRING PHYSICIAN —	MODALITY Breast Ultrasound	AI MODEL MediScan CNN v2
--------------	--------------------------	-------------------------------	-----------------------------

CLINICAL FINDINGS

Lesion detected in breast ultrasound. Approx size 1.2 cm.

AI EXPLANATION

Let's break down the ultrasound findings and what they mean:

What it means:

A lesion has been detected in your breast during the ultrasound examination. A lesion is a general term used to describe an abnormal area or tissue growth. The size of the lesion is approximately 1.2 cm, which is about the size of a small grape.

Is it dangerous?

The presence of a lesion in your breast does not necessarily mean it is cancerous. Many breast lesions are benign (non-cancerous), such as cysts, fibroadenomas, or scar tissue. However, some lesions can be malignant (cancerous), so it's essential to further evaluate the lesion to determine its nature.

The size of the lesion (1.2 cm) is relatively small, which is a good sign. Generally, smaller lesions are less likely to be cancerous. However, the only way to confirm whether the lesion is benign or malignant is through additional testing and evaluation.

What to do next:

Your doctor will likely recommend the following steps:

1. **Biopsy:** A biopsy is a procedure where a sample of tissue is taken from the lesion and examined under a microscope to determine if it's cancerous or not. There are different types of biopsies, and your doctor will discuss the best option for you.
2. **Imaging follow-up:** Your doctor may recommend additional imaging tests, such as a mammogram or an MRI, to get a better look at the lesion and determine its characteristics.
3. **Monitoring:** If the lesion is found to be benign, your doctor may recommend regular follow-up ultrasound examinations to monitor its size and characteristics over time.
4. **Consultation with a specialist:** Depending on the results of the biopsy and imaging tests, your doctor may refer you to a breast specialist or a surgeon for further evaluation and treatment.

It's essential to discuss your results and any concerns with your doctor. They will guide you through the next steps and provide you with more information about the lesion and the recommended course of action.

Remember, an abnormal ultrasound finding does not necessarily mean you have cancer. Many breast lesions are benign, and with proper evaluation and follow-up, you can get the care and treatment you need to ensure your breast health.
